

ChatGPT P5.js Creation

When asking ChatGPT to create a piece in P5.js, it asked me for parameters and specifics. I chose not to give it any parameters to let it create purely what it thought I wanted. It created the code for a bouncing blue ball in a gray square that would stay within the square. The code was easy to understand, and they even had a copy option available to copy the code for you! It was quite handy. Also I named the AI Stewart, ChatGPT Artificial Intelligence was a bit too formal and they seemed like a Stewart to me. From now on, I shall refer to the bot as Stewart.

In comparison to what Stewart created, mine was a lot more colorful and also took much much longer to make! I spent at least 4 hours trying to remember how to do everything and I enjoyed every second of it! There is no better feeling than finally fitting the pieces together and having your work run. I wonder if Stewart gets any gratification of pride from their work? I hope they do.

If I had given Stewart more details to create something specific I'm sure he would have delivered! However, I want to use Stewart as little as possible when it comes to creating code. I really want to get the basics down and the skills built myself first before returning to Stewart for assistance. As much as I appreciate Stewarts help, if I asked them to do everything for me I feel that I would enjoy the process less. Sure, it would be quicker, but I'd rather do the hard work and learn the material myself!
